

Join Children's Hospital of Philadelphia on a groundbreaking research project on driving after concussion

Did you know...

Although we know a lot about returning to sports, exercise, and school after concussion, we know very little about returning to drive after a concussion. We need the help of both healthy and recently concussed teens in our research to understand how concussion affects driving behaviors in teens.

About the study...

Who can participate?

We are looking for healthy (have not had a concussion in the last year) and recently concussed teens who are 16.5-18 years old, with a PA driver's license and their own smartphone.

What is involved?

Teens may be asked to complete surveys about themselves and download smartphone applications that track symptoms associated with concussion and/or observe real-world driving behaviors.

Teens may also be asked to complete a 3-hour session that includes surveys, clinical testing, and device testing along with a simulated driving assessment to observe driving behavior.

All teens who participate will be compensated for their time and effort.

Where does the study take place?

The Driving Simulator Lab at CHOP, or at your own home
